

GDB Debugger Reference

Compiling with Debugging Symbols

Pass the `-g` flag to your compiler:

```
z1234567@turing:~/csci241/Assign1$ g++ -Wall -std=c++11 -g -o assign1 assign1.cpp
```

Note: If you have a larger program with several files, each must be compiled with the `-g` flag, and it must also be set when you link.

If you have written a makefile, you can easily add the `-g` flag to the list of compiler variables:

```
#
# PROGRAM:    assign1
# PROGRAMMER: Ima Coder
# LOGON ID:   z1234567
# DATE DUE:   9/14/2027
#

# Compiler variables
CCFLAGS = -Wall -std=c++11 -g

# Rule to link object code files to create executable file
assign1: assign1.o
    g++ $(CCFLAGS) -o assign1 assign1.o
...
```

Setting Your Default Editor

It's very handy to be able to edit your source files from within the `gdb` debugger using the `edit` command. To enable this capability, you must specify a value for the shell environment variable `EDITOR`.

Change to your home directory and open the file `.bash_profile` in a text editor. Add the following line to the end of the file:

```
export EDITOR="/usr/bin/nano"
```

Note that you can specify a different pathname if you want a different editor such as Vim ("`/usr/bin/vim`") or Emacs ("`/usr/bin/emacs`").

Save the file and exit.

Then, either log out and log back in, or type the command

```
source .bash_profile
```

Starting the Debugger

Start the debugger with your executable program name as the first argument. For example, if the name of the executable file is `assign1`, then you need to type:

```
gdb assign1
```

Here's an example of what you'll typically see when the debugger starts:

```
z1234567@turing:~/csci241/Assign1$ gdb assign1
GNU gdb (Debian 7.7.1+dfsg-5) 7.7.1
Copyright (C) 2014 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law.  Type "show copying"
and "show warranty" for details.
This GDB was configured as "x86_64-linux-gnu".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from assign1...done.
(gdb)
```

You can now type debugger commands at the `gdb` prompt. Some of the most commonly used `gdb` commands are listed on the following two pages. This list is not exhaustive, and there are many other commands and options available.

Command	Description	Examples
Getting help		
help	Get a list of classes of debugger commands.	help
help <i>class-name</i>	Get a list of all commands in the specified command class.	help breakpoints
help <i>command</i>	Get documentation for a specific command within a class.	help break
Setting command-line arguments and redirection		
set args <i>arg1 arg2 ...</i>	Specify command-line arguments. You may also use this command to redirect input or output for the program.	set args in.txt 20 set args in.txt > out.txt
set args	Cancel previous command-line arguments and redirection.	set args
Executing the program		
run	Run the program you are debugging. The program will run until it terminates or it hits a breakpoint.	run
continue	Continue executing program being debugged after it has hit a breakpoint. Execution will continue until termination or the next breakpoint. This command may be abbreviated as <i>c</i> .	c
finish	Continue executing until the current function returns.	finish
next	Execute next program statement, stepping over subroutine calls. This command may be abbreviated as <i>n</i> .	n
next <i>n</i>	Step over next <i>n</i> program statements.	next 3 n 4
step	Execute next program statement, stepping into subroutine calls. This command may be abbreviated as <i>s</i> .	s
step <i>n</i>	Step into next <i>n</i> program statements.	step 2
kill	Kill execution of program being debugged.	kill
Breakpoints		
break <i>n</i>	Set a breakpoint on line <i>n</i> of the current source file. The command <i>tbreak</i> can be used instead to set a temporary breakpoint that will only be triggered once.	break 51
break <i>filename:n</i>	Set a breakpoint on line <i>n</i> of the specified source file.	break other.cpp:32
break <i>function-name</i>	Set a breakpoint at the beginning of the specified function.	break buildArray
break <i>function-name<type></i>	Set a breakpoint at the beginning of the specified template function.	break compare<int>
break <i>class-name::function-name</i>	Set a breakpoint at the beginning of the specified C++ member function.	break Date::print
break <i>class-name<type>::function-name</i>	Set a breakpoint at the beginning of the specified C++ template member function.	break Stack<int>::push
info breakpoints	Show status of breakpoints. Can optionally be followed by a list of specific breakpoint numbers; defaults to all breakpoints	info breakpoints info breakpoints 1 3
disable breakpoints <i>n1 n2 ...</i>	Disable specified breakpoint numbers. Defaults to all. May be abbreviated as <i>disable</i> .	disable 3
enable breakpoints <i>n1 n2 ...</i>	Enable specified breakpoint numbers. Defaults to all. May be abbreviated as <i>enable</i> .	enable 2 3
delete breakpoints <i>n1 n2 ...</i>	Delete specified breakpoint numbers. Defaults to all. May be abbreviated as <i>delete</i> .	delete 1

Command	Description	Examples
Watchpoints		
<code>watch expression</code>	A watchpoint stops execution of your program whenever the value of the specified expression changes. A watchpoint is a specific type of breakpoint and can be enabled, disabled, or deleted using the same commands.	<code>watch playerName</code>
<code>watch -location expression</code>	Evaluates expression and watches the memory location to which it refers. <code>-location</code> may be abbreviated as <code>-l</code> .	<code>watch -l ptrName</code>
<code>info watchpoints</code>	Show status of watchpoints only. Can optionally be followed by a list of specific watchpoint numbers; defaults to all watchpoints	<code>info watchpoints</code> <code>info watchpoints 1 3</code>
Examining and modifying variables		
<code>print expression</code>	Print the current value of the specified expression or variable name.	<code>print num</code> <code>print providerArray[3]</code>
<code>set var = expression</code>	Set the specified variable to the specified expression.	<code>set x = 3</code>
<code>display expression</code>	Get a list of classes of debugger commands.	<code>help</code>
<code>info display</code>	Lists expressions to display when program stops, with code numbers.	<code>info display</code>
<code>disable display n1 n2 ...</code>	Disable specified display expression code numbers. Defaults to all.	<code>disable 3</code>
<code>enable display n1 n2 ...</code>	Enable specified display expression code numbers. Defaults to all.	<code>enable 2 3</code>
<code>undisplay n1 n2 ...</code>	Cancel the specified display expression code numbers. Defaults to all.	<code>undisplay 1</code>
Listing source code		
<code>list</code>	List ten more lines after or around previous listing.	<code>list</code>
<code>list n</code>	List ten lines around the specified line. Line number arguments may be preceded by a filename.	<code>list 51</code> <code>list Provider.cpp:20</code>
<code>list function</code>	List ten lines around the specified function.	<code>list buildArray</code>
<code>list class-name::function-name</code>	List ten lines around the specified C++ member function.	<code>list Provider::print</code>
<code>list +</code>	List the ten lines after the previous listing.	<code>list +</code>
<code>list -</code>	List the ten lines before the previous listing.	<code>list -</code>
<code>list x,y</code>	List the specified range of line numbers.	<code>list 10,35</code>
Other commands		
<code>make</code>	Run the <code>make</code> program using the rest of the line as arguments.	<code>make</code> <code>make clean</code>
<code>file executable-filename</code>	Use <code>executable-filename</code> as program to be debugged.	<code>file assign1</code>
<code>edit</code>	Edit a source or header file.	<code>edit</code>
<code>edit filename:n</code>	Edit at the specified line number in the specified file.	<code>edit Date.cpp:10</code>
<code>edit function</code>	Edit at the beginning of the specified function. May be optionally preceded by a filename.	<code>edit buildArray</code> <code>edit sorts.cpp:compare</code>
<code>edit class-name::function-name</code>	Edit at the beginning of the specified C++ member function.	<code>edit Provider::print</code>
<code>quit</code>	Exit the debugger. May be abbreviated <code>q</code> .	<code>quit</code>
